IIDD 2 FINAL COURSE PROJECT

Individual Web Portfolio for Industry & OJT Placement
Project Documentation

Course Code & Title:	IIDD 2 – Industrial Interface Design and Development 2
Project Name:	Derek Allen D. Vitto – OJT Web Portfolio
Student Full Name:	Derek Allen D. Vitto
Student ID:	2023105255
Program & Section:	BIT – Computer Technology, [Section]
Instructor:	Vinna Ramos
Live Deployment URL:	https://allenvit0.github.io/ojt-portfolio/
Date of Submission:	November 6, 2026

Section 1: Developer Profile & Links

Target Industry Track / Role

UI/UX & Front-End Web Developer Intern

Live Deployment URL

https://allenvit0.github.io/ojt-portfolio/

Public GitHub Repository Link

Professional Elevator Pitch

I am a Computer Technology student at the College of Industrial Technology, Bulacan State University, who designs interfaces in Figma and builds them with HTML, CSS, and JavaScript. My background in Computer System Servicing and MySQL means I understand both the hardware and the data behind an application. I am ready to help a partner company's web or IT team turn ideas into clean, usable interfaces during my 500 training hours.

Cover Letter

November 6, 2026

The Hiring Manager
Human Resources Department

Dear Hiring Manager,

I am writing to apply for an On-the-Job Training position as a UI/UX and Front-End Web Developer Intern at your company. I am a Bachelor of Industrial Technology student majoring in Computer Technology at Bulacan State University – College of Industrial Technology, and I am required to render 500 training hours starting the 2nd Semester of A.Y. 2026–2027.

I enjoy planning screens before building them. I design wireframes in Figma and turn them into responsive pages using HTML, CSS, and JavaScript. My portfolio includes the Kapehan Café Ordering Kiosk, a touch-friendly ordering interface, and a PC Parts Inventory Manager with add, edit, search, and low-stock features backed by a MySQL table design. My senior high school track in Computer System Servicing also gave me hands-on experience with hardware assembly and troubleshooting.

I am eager to learn from your team, accept feedback, and contribute from my first day. My portfolio, CV, and live project demos are available at https://allenvit0.github.io/ojt-portfolio/. Thank you for your time and consideration. I look forward to hearing from you.

Respectfully yours,

Derek Allen D. Vitto

Section 2: Technology Stack & AI Tooling

1. Coding Environment & Core Stack

The portfolio is written in semantic HTML5 (header, nav, main, section, article, footer) and CSS3 using Flexbox, CSS Grid, and media queries, with a small vanilla JavaScript file that highlights the current section in the navigation bar. The two projects also use plain JavaScript, and the inventory project includes a MySQL schema file. I used Visual Studio Code to review and edit the files, Google Chrome DevTools device mode to test phone and tablet widths, and the Console tab to check for errors. Typefaces come from Google Fonts: Bricolage Grotesque for headings, Manrope for body text, and DM Mono for labels.

2. AI & Vibe Coding Tools Used

I used Claude (Anthropic) through the Claude app as my AI development tool. I chose it because I could give it the full IIDD 2 guidelines and all of my personal details in one conversation, and it could produce the complete folder structure, test the pages in a browser, and generate supporting files such as my CV.

3. Deployment Platform

I chose GitHub Pages because it is free, it is the recommended option in the guidelines, and it serves the site directly from the same public repository that holds my source code. The site is deployed from the *main* branch, root folder.

Section 3: Prompt Engineering Strategies & Iteration Log

1. Prompting Strategies Applied

Technique 1: Constraint-based prompting

I told the AI to build the portfolio "based only in the guidelines" and to use a different design from another student's portfolio. This made the IIDD 2 requirements the only specification: the folder structure, the required hero items, internship metrics, the five skill categories, at least two projects, the contact section, and the footer. It also kept the AI from copying an existing layout.

Technique 2: Context-setting with complete personal data

In the same prompt I supplied everything the AI needed up front: my full name, contact number, email, address, objective, college and senior high school background, skills list, student number, LinkedIn URL, my formal photo, and a screenshot of my GitHub profile showing the *ojt-portfolio* repository. Because the context was complete, the AI could fill real links and details instead of placeholders.

2. Prompt Iteration Log

Instance A (Layout / Component Issue)

Initial Prompt Given:

> *"this one also same guidelines different but different design and do it based only in the guidelines" followed by my personal details, skills, student number, and LinkedIn link, with my photo and GitHub screenshot attached.*

Flaw in AI Output: [Describe what was wrong in the first version you reviewed, e.g. a section that looked off on your phone, a label you wanted changed, or a skill placed in the wrong category.]

Corrective Follow-Up Prompt / Strategy Used: [The follow-up prompt you gave to fix it.]

Instance B (Styling / Behavioral Issue)

Initial Prompt Given:

> *Same prompt as Instance A. I gave no target role, training hours, availability window, preferred location, or projects.*

Flaw in AI Output: Because those details were missing, the AI filled them with its own assumptions: the role "UI/UX & Front-End Web Developer Intern", 500 training hours, availability starting the 2nd Semester of A.Y. 2026–2027, "Malolos, Bulacan / Remote" as the preferred setup, and two new demo projects. These looked like confirmed facts on the page even though I had not provided them.

Corrective Follow-Up Prompt / Strategy Used: [Your follow-up, e.g. confirming or correcting the hours, availability, and location, and asking the AI to explain how each project works.]

Section 4: Real Bottlenecks & Practical Problem-Solving

Bottleneck 1: Layout & Mobile View Quirks

The desktop hero places my name and buttons beside a large photo frame, and the internship metrics sit in a three-column strip. At phone width (390px) these columns would be too narrow and the long LinkedIn link could push the page sideways. The fix was a media query below 640px that stacks the hero into one column with the photo first, turns the metrics strip into three stacked rows, makes the CV and Contact buttons full width, and lets long links wrap with *overflow-wrap: anywhere*. The inventory table in the second project was given its own horizontally scrolling container so only the table scrolls, not the whole page. I checked in DevTools device mode that the page width matches the screen width. [Add anything else you noticed on your own phone.]

Bottleneck 2: Live Deployment / Asset Loading Issues

Because the site lives under the sub-path */ojt-portfolio/*, any link starting with "/" would break. Every stylesheet, image, CV, and project link therefore uses a relative path such as *assets/css/style.css* and *projects/cafe-kiosk/index.html*. GitHub Pages also had to be enabled in Settings → Pages (Deploy from a branch, *main*, */ (root)*) before the URL stopped returning "Site not found". [Describe any issue you actually hit when uploading, e.g. uploading the outer folder instead of its contents.]

Bottleneck 3: Working with AI-Generated Code

The AI produced the portfolio and two complete JavaScript projects at once, so the hardest part was making sure I understood the code well enough to explain and maintain it. I tested the kiosk by switching categories, adding items, changing quantities, and placing an order, and I tested the inventory by adding, editing, searching, and deleting parts and checking the low-stock count. I also compared the inventory fields with the *parts* table in *schema.sql* to connect the demo with my MySQL knowledge.

Section 5: Experience Reflection & OJT Readiness

1. Human vs. AI Roles

The AI did best at structure and speed: it followed the guideline checklist closely, separated the files into the required folders, and produced a consistent design system across the portfolio and both projects. It failed where it lacked my information. It had to guess my role, hours, availability, and location, and it could not know what I wanted my projects to be. Those decisions, plus uploading to GitHub, enabling Pages, testing on my own phone, and studying the code, required my own work.

2. OJT Industry Readiness

The Featured Projects section best shows my readiness. The Kapehan Café Ordering Kiosk demonstrates UI/UX thinking: large touch targets, clear categories, and immediate

feedback in the cart. The PC Parts Inventory Manager shows that I can build a practical business tool and design the database behind it in MySQL.

3. Future Upgrades

Before sending the portfolio to companies, I plan to add my original Figma wireframes for both projects so recruiters can see my design process from sketch to finished screen. I also want to connect the inventory manager to a real MySQL database through a PHP back end.

Section 6: Proof of Deployment & Screenshots

Full-page desktop view (live site)

[Insert screenshot: https://allenvit0.github.io/ojt-portfolio/ on desktop, with the browser address bar visible]

Full-page mobile view (live site)

[Insert screenshot: live site in Chrome DevTools device mode or on your phone, with the address bar visible]
